Dear Sam:

Subject: Paul R. Williams

On September 3 I examined Mr. Williams and discovered a Stage 1A, Cleaved B cell follicular lymphoma in the left inguinal region. I conducted a surgical excision and recommended radiation therapy. Mr. Williams completed his radiation therapy four weeks ago and feels well at this time. He has no complaints, his appetite and energy are normal, and he looks good. His weight is down five pounds upon my recommendation four weeks ago that he lose some excess weight.

There are no abdominal or inguinal lymph nodes to his scrotal sac exam. There are, however, three- to four-millimeter nodes in the right inguinal region that appear totally unchanged from his original exam on September 3. His lungs are clear, his heartbeat is regular, the liver and spleen are not enlarged, and there are no palpable masses.

It appears to me that Mr. Williams has recovered satisfactorily from his radiation therapy. He has requested a second opinion, and I am therefore recommending that he make an appointment with you at his earliest convenience. We will prepare a referral for Mr. Williams and forward it to your office in a day or two.

Sincerely,

Donna Stensland, M.D.
